Sequence 97, Application US/09873676
Patent No. US20020077289A1
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Sim, Kim L.
TITLE OF INVENTION: Angiotetatin and Endostatin Binding Proteins and Methods of Use
TILE REFERENCE: 65213-0378 (43170-25933)
CURRENT FILING DATE: 2001-06-04
PRIOR APPLICATION NUMBER: US 60/209,065
PRIOR PLING DATE: 2000-06-02
PRIOR FILING DATE: 2000-06-02
PRIOR FILING DATE: 2001-05-08
NUMBER OF SEQ ID NOS: 123
SOFTWARE: Patentin version 3.1
                                                                ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 5
US-09-315-304B-1000

i Sequence 1000, Application US/09315304B

i Patent No. 634856B

i GENERAL INFORMATION:

APPLICANT: Barney, S.

APPLICANT: Guthite, K.

APPLICANT: Anwer, M.

APPLICANT: Lambert, D.

TITLE OF INVENTION: HYBRID POLYPEPTIDES WITH ENHANCED PHARMACOKINETIC

TITLE OF INVENTION: PROPERTIES

FILE REFERENCE: 7872-052

CURRENT FILING DATE: 1999-05-20

PRIOR FILING DATE: 1999-05-20

NUMBER OF SEQ ID NOS: 1667

SOFTWARE: FastSEQ for Windows Version 3.0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 4, Application US/08619280A
Patent No. 5767242
GENERAL INFORMATION:
APPLICANT: Entering, Wolfgang; Old, Lloyd J.
TITLE OF INVENTION: ISOLATED DIMERIC FIBROBLAST ACTIVATION PROTEIN
TITLE OF INVENTION: ALPHA, AND USES THEREOF
NUMBER OF SEQUENCES: 10
CORRESPONDENCE ADDRESS:
ADDRESSEE: Felfe & Lynch
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GENERAL INFORMATION:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Primary structure of two neuropeptide hormones with adipokinetic and

Thypotrehalosemic activity isolated from the corpora cardiaca of horse

THIS (Diptera).";

Proc. Natl. Acad. Sci. U.S.A. 86:8161-8164(1989).

THIS HORNOWE, RELEASED FROM CELLS IN THE CORPORA

CARDIACA AFTER THE BEGINNING OF FLIGHT, CAUSES RELEASE OF

DIGLYCERIDES FROM THE FAT BODY AND THEN STIMULATES THE FLIGHT

MUSCLES TO USE THESE DIGLYCERIDES AS AN ENERGY SOURCE.

SIMILARITY: BELONGS TO THE AKH / HRTH / RPCH FAMILY.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                           A_Geneseq_19Jun03:*

Decrein genes, and ABP00947-ABP01363 represent the proteins they encode.

Mag2732894-ABZ74687 represent human secreted protein genomic fragments. The invention also encompasses antibodies specific for the secreted proteins. The encompasses antibodies specific for the secreted proteins. The vectors and host cells comprishing a nucleic acid of the invention. The secreted proteins are thought to be involved in biological activities associated with cellular signalling, cellular differentiation, cell migration, prohormone activation and neurotransmitter activity. The secreted proteins, nucleic acids encoding them, antibodies or antibody fragments specific for the secreted proteins, and modulators of protein secreted proteins are useful for diagnosing or treating cancers or other hyperproliferative disorders. Additionally, the secreted proteins and thair nucleic acids may also be used in the treatment of autoimmune considers, inflammatory disorders, diseases involving angiogenesis, AIDS (acquired immunodeficiency syndrome), hepatitis, anaemia, and to promote cound healing. Nucleic acids of the invention may be used for chromosome individuals from minute biological samples, as hybridisation probes, and secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (HUMA-) HUMAN GENOME SCI INC

                                                                                                                           The present sequence is a peptide fragment of human luteinising hormone releasing hormone (also known as LHRH, GnRH and gonadotrophin releasing hormone), which has spacers inserted at the N-terminus. It was used to demonstrate the novel adjuvant of the invention, which has lower reactogenicity then previous compositions. Vaccination of humans and animals against LHRH can be used as a method of fertility control, as well as enabling the control and treatment of disorders of the reproductive organs, such as testicular, breast, prostate and ovarian cancers, prostate enlargement and endometriosis. The composition of the linvention contains an amionic macromolecule and a saponin component, the latter of which is an immunostimulant, and it can also be used with other immunogens including soluble protein and it can also be used with other to a carrier protein and whole viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human secreted proteins and nucleic acids, useful for detecting or treating cancer or other hyperproliferative disorders, autoimmune disorders, inflammatory disorders, HIV disease, hepatitis or anemia -

                                                                                           The invention relates to novel human genes (ABZ66891-ABZ68209) and the encoded secreted proteins (ABP99470-ABP99872) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung or urogenital; (b) immune disorders e.g. Addison's disease, altergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid carthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anexia and epilepsy, and (f) infectious diseases such as viral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

generically claimed mono-, di, tri-, tetra- and penta-peptides
which include a substituent on an alpha-C atom in the chain. Such
substitution may modify the bioavailability, stability or
c absorbability of the peptide and hence may improve the activity of
the peptide as a drug. Depending on the nature of the parent peptide
(hormone, endorphin, CCK, NKZ, chemitacito peptide, etc.), the
modified peptides are variously useful for treating obesity, anxiety,
gastrointestinal ulcers, pain, stroke, inflammation, addictive drug
withdrawal symptoms, hypertension, heart failure, cognition or memory
discussion, psychosis and arthritis, and as contraceptives.

The peptide is a specifically claimed example of a group of generically claimed mono., di., tri., tetra- and penta-peptides which include a substituent on an alpha-C atom in the chain. Such absorbability of the poptide and hence may improve the activity of the peptide as a drug. Depending on the nature of the parent peptide (hormone, endorphin, CCK, NK2, chemotactic peptide, etc.), the modified peptides are variously useful for treating obesity, anxiety, gastrointestinal ulcers, pain, stroke, inflammation, addictive drug withdrawal symptoms. Mypertension, heart failure, cognition or memory disorders, spasticity, depression, diabetes, cancer, asthma, bladder (Updated on 25-MAR-2003 to correct PM field.)

                                                                                                                                                                                                                                                                                                           ö
                  The peptide is a specifically claimed example of a group of generically claimed mono-, di-, tri-, tetra- and penta-peptides which include a substituent on an alpha-C atom in the chain. Such absorbability of the program and hence may improve the activity of the peptide and hence may improve the activity of the peptide as a drug. Depending on the nature of the parent peptide (hormone, endorphin, CCK, NK2, chemotactic peptide, etc.), the modified peptides are variously useful for treating obseity, anxiety, gastrointestinal ulcers, pain, stroke, inflammation, addictive drug withdrawal symptoms, hypertension, heart failure, cognition or memory disorders, spaticity, depression, diabetes, cancer, asthma, bladder (Updated on 25-MAR-2003 to correct PV field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a modified therapeutic peptide (1) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidy) and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases. AMB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The invention relates immunogenic composition for eliciting an immune response to luteinising hormone releasing hormone (LHRH). The composition comprises a LHRH-diphtheria toxoid (DT) conjugate adsorbed to an ionic polysaccharide. The LHRH-OT compositions can be used for eliciting an immune response to LHRH, for castrating an animal, for regulating oestrus cycling in a female animal or for inhibiting characteristics induced by the sexual maturation of an animal, e.g. aggression or sexual activity. They can also be used for achieving production gains in livestock, e.g. reduction or elimination of unwanted organoleptic characteristics from the meat of livestock. They can also be used for inhibiting the growth of cells which are regulated directly or indirectly by LHRH, e.g. malignant oncofoetal cells or indirectly by LHRH, e.g. malignant concofoetal cells or cells, manignant ovarian cells, malignant concofoetal cells or of an animal. They can also be used for inhibiting pregnancy, prostate calargement, endometriosis or inflammatory responses The LHRH than the carrier adjuvant compositions. The effective immune response against LHRH results in prevention of the release of the hormones LH and an animal and an animal release of the hormones LH and animal and an animal and animal and animal animal and animal animal and animal anim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                               LHRH(3-10) is highly immunogenic but lacks the hormonal properties of natural LHRH. Conjugates of the peptide with an immunogenic carrier protein can be used as an anti-LHRH vaccine. (An alpha-globulin/LHRH conjugate can also be used as anti-LHRH vaccine). The vaccines are administered shortly before slaughter to suppress the action of androgenic and non-androgenic hormones in non-castrated male animals. This allows the advantages associated with the male character (greater weight gain, more efficient feed utilisation and leaber carcasses) to be retained practically up to the time of slaughter. The treatment does not induce any local reactions which could result in the meat being rejected on grounds of quality.

                                                                                 The present sequence is a peptide fragment of human luteinising hormone releasing hormone (also known as LHRH, GnRH and gonadotrophin releasing hormone). It was used to demonstrate the novel adjuvant of the invention, which has lower reactogenicity then previous compositions. Vaccination of humans and animals against LHRH can be used as a method of fertility control, as well as enabling the control and treatment of disorders of the reproductive organs, such as testicular, breast, prostate and ovarian cancers, prostate enlargement and endometriosis. The composition of the invention contains an anionic macromolecule and a saponin component, the latter of which is an immunostimulant, and it can also be used with other immunogens including soluble protein antigens, peptide haptens conjugated to a carrier protein and whole viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptides of the SQs in AAP60174 and AAP60175 are claimed, the last 8 AAs
                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence of luteinising hormone releasing hormone (LHRH) analogue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Contraception; vaccine; cryptorchidism; prostate cancer therapy;

APPLICANT: Dufour, Raymond J.
APPLICANT: Dufour, Raymond J.
APPLICANT: Dufour, Claude J.M.
APPLICANT: Chouvet, Claire D.
APPLICANT: Bonneau, Michel B.
TITLE OF INVENTION: Method for improving the organoleptic
TITLE OF INVENTION: qualities of the meat from uncastrated male domestic
TITLE OF INVENTION: animals, vaccines which are usable in this method, new
TITLE OF INVENTION: peptide, in particular for producing these vaccines.
NUMBER OF SEQUENCES: 2
